PLASTEC NOTE 10

THERMAL OXIDATION, AND THERMAL ANALYSIS OF HIGH POLYMERS

**JANUARY 1966** 

PLASTICS TECHNICAL EVALUATION CENTER

PICATINNY ARSENAL DOVER, NEW JERSEY

Authorized by the Office of Director of Defense Research and Engineering, the Plastics Technical Evaluation Center (PLASTEC) evaluates and disseminates technical information on current development, engineering, and application work in the field of plastics and reinforced plastics. It engages in materials surveys and other special assignments, and provides the Department of Defense with technical data and advice on research and development programs on plastics.

Army, Navy and Air Force installations, and contractors and other suppliers of defense needs may request information from this center directly.

PLASTEC documents are distributed automatically to qualified organizations and individuals, according to the stated interest established in its Field of Interest Register (FOIR).

Unless otherwise stated below, PLASTEC reports are available to qualified requesters from the Defense Documentation Center (Fig., Cameron Station, Alexandria, Virginia, 22314; and to the general public arough the Clearinghouse for Federal Scientific and Technical Information (CFSTI), 5285 Port Royal Road, Springfield, Virginia 22151.

# **ABSTRACT**

A bibliography of references, many of them annotated, is presented. This bibliography is the result of a literature survey on thermal degradation, thermal oxidation and thermal analysis of high polymers. These references cover the period from about 1 October 1562 to 1 March 1965. 702 items are given. These are grouped under general and material headings. A subject index and an index of authors are provided. This bibliography brings PLASTEC NOTE 7, published June 1963, up-to-date.

The matter as to the facilities of the

# INTRODUCTION

This bibliography brings the material reported in PLASTEC NOTE 7 up to about 1 March 1965. The coverage and arrangement follows essentially the same pattern as the earlier report.

For the convenience of the reader a rather extensive index is included.

#### THEORY AND MATHEMATICAL TREATMENT

## Ref. No.

H.. Friedman, KINETICS OF THERMAL DEGRADATION OF CHAR-FORMING PLASTICS FROM THERMOGRAVIMETRY. APPLICATION TO A PHENOLIC PLASTIC, J. Polymer Sci. C6, 183

A technique was devised for obtaining rate laws and kinetic parameters which describe the thermal degradation of plastics from TGA data. The method is based on the intercomparison of experiments which were performed at different linear rates of heating. By this method it is possible to determine the activation energy of certain processes without knowing the form of the kinetic equation.

H. C. Anderson, THERMOGRAVIMETRY OF POLYMERS. PYROLYSIS KINETICS, J. Polymer Sci. <u>C6</u>, 175

Two TGA methods were developed to study kinetics of polymer degradation.

- 16 L. A. Dudina and N. S. Enikolopyan, MECHANISM OF INITIATION IN THE THER-MAL DEGRADATION OF POLYMERS, Vysokomolekul. Soedin. 4, 869 (1962)

Proposes a method for determining the mechanism of active-center generation in the thermal degradation of polymers based on determining the dependence of the effective rate constant upon the initial DP. The validity of the method is confirmed by data on the thermal degradation of polyformaldehyde.

17 C. D. Doyle, ESTIMATING ISOTHERMAL LIFE FROM THERMOGRAVIMETRIC DATA, J. Applied Polymer Sci. 6, 639 (1962)

Equations are given for estimating equivalent isothermal life from TGA data and for estimating apparent activation energy for volatilization even though the nature of the kinetic process is unknown. Illustrative data for polytetrafluoroethylene are given.

V. K. Semenchenko and M. M. Martynyuk, THE THERMODYNAMICS OF POLYMERS.
II. COMPARISON OF CONCLUSIONS DERIVED FROM THE MESOMORPHIC PHASE
THERMODYNAMICS WITH EXPERIMENTAL DATA, Kolloidn. Zh. 24, 611 (1962);
C. A. 58, 9240 (1963)

The minimum of the thermal stability corresponds to the melting point of crystalline polymers and to the glass point of amorphous polymers. High elasticity of polymers is observed in the region of their lover thermal stability.

### THEORY AND MATHEMATICAL TREATMENT - Continued

### Ref. No.

19 S. Strella, DIFFERENTIAL THERMAL ANALYSIS OF POLYMERS. II. MELTING, J. Applied Polymer Sci. 7, 1281 (1963)

A theory is presented of the way in which the melting of a polymer is manifested in a differential temperature analysis thermogram. An analytical method based on this theory allows a precise determination of both the melting point and the crystalline weight fraction as a function of temperature. Experimental results for linear polyethylene and crystalline polypropylene confirm the theory.

20 S. Strella, DIFFERENTIAL THERMAL ANALYSIS OF POLYMERS. I. THE GLASS TRANSITION, J. Applied Polymer Sci. 7, 569 (1963)

A differential thermal analysis device (DTA) for measuring the glass and other polymer transitions is described. A theory on the manner in which a glass transition is manifested in a DTA thermogram, and on the manner for obtaining the real value from the thermogram is presented. Experimental results on polymethyl methacrylate and atactic polypropylene verify the various predictions of the theory.

## Polystyrene - Continued

# Ref. No.

By TGA studies polymers were classified into types. Type I (e.g. polystyrene, (poly(methyl methacrylate), acetal resins) depolymerize mainly into monomers over a small temperature range. Type II (e.g. poly(vinyl chloride), polyamides, polyurethanes) decompose in two steps. Type III (e.g. poly(vinyl alcohol) and diene polymers) decompose over a much wider range of temperature due to various irregular chain scissions and side-chain splittings as well as depolymerization to monomer.

Oxidations were conducted on films in an air oven at 200°C for various times. The oxidized films were dissolved and various parameters were obtained on the solutions. Fractionation of unoxidized and oxidized thermally polymerized polystyrene showed a narrowing of molecular weight distribution during oxidation. There was a marked decrease in Mw on oxidation. The results indicate that random chain scission of oxidized polymer occurs along with formation of carbonyl groups giving molecules of shorter chain length, most of which probably retain the initial linear random coil structure. In addition to chain scission, branching and crosslinking are indicated by distortion of Zimm plots by microgel.

### Ref. No.

A mechanism of thermal degradation of polyolefins is proposed to explain the formation of volatile products. It consists of chain bond rupture with formation of 2 chain-end radicals, isomerization of the radicals through shifting of H atoms, and bond rupture at the radical C atom. The low molecular weight products predicted by this mechanism for polyethylene and polypropylene degradation were confirmed experimentally.

Films were irradiated by  $\gamma$ -rays and the induction period of oxygen absorption at  $180^{\circ}\text{C}$  was determined to check the stability. The induction period decreased as the radiation dose increased. The chief mechanism was the destruction of the inhibitor due to its reaction with products of irradiation oxidation of the polymer.

Infrared spectroscopy was used to follow the kinetics over the temperature range  $100-130^{\circ}$ . A deuterium isotope effect was found for the thermal oxidation of polypropylene.

D. Poller and A. M. Kotliar, EFFECTS OF DEGRADATION ON POLYPROPYLENE MELT RHEOLOGY, J. Applied Polymer Sci. 9, 501 (1965)

The rheological behavior of a molten polypropylene resin is governed primarily by its weight-average molecular weight and its molecular weight distribution. When the polymer is exposed to processing operations carried out at high temperatures, oxidative conditions, and high shear stresses, significant degradation often results, causing major changes in molecular weight and molecular weight distribution.

Some data on heat distortion properties are given.

A. E. Newkirk, A. S. Hay and R. S. McDonald, THERMAL DEGRADATION OF POLY (m-DIETHYNYLENE BENZENE), J. Polymer Sci. A2, 2217 (1964)

Degradation of the polymer was studied by TGA, x-ray diffraction, and infrared spectroscopic techniques. TGA experiments (in nitrogen) showed that the main weight losses occurred in two stages. The weight loss of the first stage, from room temperature to  $200^{\rm o}$ C, is probably due to loss of solvent from the polymer, and some first stage decomposition. The second stage loss was from  $300^{\rm o}$  to  $800^{\rm o}$ C.

# Ref. No.

D. A. Frey, M. Hasegawa, and C. S. Marvel, PREPARATION AND AROMATIZA-TION OF POLY-1,3-CYCLOHEXADIENE. II, J. Polymer Sci. A1, 2057 (1963)

Further work on the polymerization of 1,3-cyclohexadiene by the action of Ziegler-type catalysis and by cationic initiation has been carried out and polymers with an inherent viscosity of 0.1-0.19 have been obtained consistently. Dehydrogenation of the poly-1,3-cyclohexadiene by halogenation followed by pyrolysis has given good conversion to a polyphenyl which has some units which are incompletely aromatized. This polymer has very good heat stability but is not a useful polymer for plastic purposes.

### Chlorinated Polypropylene

### Ref. No.

B. A. Krentsel, G. E. Semenido and D. E. Il'ina, DECOMPOSITION OF CHLORINE-CONTAINING POLYMERS. I. THERMAL DECOMPOSITION OF CHLORIN-ATED POLYPROPYLENE, Vysokomolekul. Soedin. 5, 358 (1963)

Thermal decomposition of chlorinated stereoblock polypropylene polymers containing 60% atactic fraction and 3 to 75% Cl was studied at different temperatures. At  $100^{\rm o}$  to  $238^{\rm o}$ C, the dehydrochlorination rate increased with increase of temperature. Above  $250^{\rm o}$ C, HCl and other gases were evolved, indicating the rupture of C-C bonds in the polymer backbone.

Studied loss of solubility in dichloroethane and change of melt viscosity of samples heated for different periods at 180 and at  $200^{\circ}$ . Also investigated the effect of several stabilizers.

A. A. Berlin, Z. V. Fopova, and D. M. Yanovskii, POLYMERS WITH CON-JUGATED BONDS IN THE MACROMOLECULAR CHAINS, SPE Trans. 3, No. 1, 27 (1963)

Studied the effect on stability of poly(vinyl chloride) of polymeric compounds with conjugated bonds, prepared by dehydrochlorination

# Ref. Nc.

of poly(vinyl chloride) or by polymerization of phenylacetylene with p-diethynylbenzene. It was found that polymers with conjugated bonds are effective inhibitors of the thermal dehydrochlorination of poly (vinyl chloride).

A. A. Berlin, V. I. Kasatochkin, R. M. Aseeva and S. B. Finkel'shtein, POLYMERS WITH CONJUGATED BONDS AND HETEROATOMS IN THE CONJUGATE CHAIN. XXIX. PREPARATION AND PROPERTIES OF THE POLYMERIC PRODUCTS OF DEHYDRO-CHLORINATION AND CARBONIZATION OF POLY(VINYL CHLORIDE) AND OF CHLORINATED POLY(VINYL CHLORIDE), Vysokomolekul. Soedin. 5, 1303 (1963)

Poly(vinyl chloride) (alternating 1,3-distribution of Cl atoms) and chlorinated poly(vinyl chloride) (mixed distribution of Cl atoms) were heated in inert atmosphere at from 300 to 700°C for 1 hour. The products of thermolysis were analyzed chemically and their x-ray diagrams, electron spin resonance spectra, and electrical conductivity were determined. The extra Cl atoms in the chlorinated polymer caused a considerable increase in the yield of thermolysis products, and the solubility of these products was much higher. The soluble portion was composed mostly of high molecular weight unidentified products.

W. I. Bengough and H. M. Sharpe, THE THERMAL DEGRADATION OF POLY(VINYL CHLORIDE) IN SOLUTION. I. THE KINETICS OF THE DEHYDROCHLORINATION REACTION, Makromol. Chem. 66, 31 (1963)

The dehydrochlorination in EtOBz solution was studied at 178-2120 in nitrogen. Kinetic data are reported. The presence of oxygen was found not to affect the rate of dehydrochlorination, but it caused a more rapid blackening of the polymer solution, and is accompanied by chain scission.

W. I. Bengough and H. M. Sharpe, THE THERMAL DEGRADATION OF POLY(VINYL CHLORIDE) IN SOLUTION. II. THE KINETICS OF THE CROSSLINKING REACTION, Makrcmol. Chem. 66, 45 (1963)

The effect of variation in polymer concentration and in polymer molecular weight on the 'ime taken for the polymer solution to gel was observed, and the rate of crosslinking was calculated from such data. The mechanism is discussed.

The methods of preparation and the properties of self-extinguishing epoxide resins (containing F, Cl, or Br a substituents) are reviewed.

D. E. Ilyina, B. A. Krentsel, and G. E. Semenido, LOW TEMPERATURE POLY-MERIZATION OF CHLOROSUBSTITUTED ALDEHYDES, J. Polymer Sci. C4, Part 2, 999 (1963)

Polychloral was heated under vacuum at various temperatures. Possible processes occurring in the thermal decomposition are discussed.

D. A. Smith, THERMAL STABILITY OF CHLOROSULFONATED POLYETHYLENE, J. Pol, mer Sci. <u>B2</u>, 665 (1964)

TGA studies under nitrogen were carried out. Some kinetic results are reported.

J. M. Cox, B. A. Wright, and W. W. Wright, THERMAL DEGRADATION OF FLUORINE-CONTAINING POLYMERS. PART I. DEGRADATION IN VACUUM, J. Applied Polymer Sci. 8, 2935 (1964)

A large number of polymers were studied and compared.

J. M. Cox, B. A. Wright, and W. W. Wright, THERMAL DEGRADATION OF FLUORINE-CONTAINING POLYMERS. PART II. DEGRAPATION IN OXYGEN, J. Applied Polymer Sci. 8, 2951 (1964)

Relative stabilities were determined for a considerable number of polymers (see Part I) (Ref. 321).

323 T. D. D'yachenko, N. A. Glukhov, M. M. Koton, and Yu. N. Sazanov, SYNTHESIS AND POLYMERIZATION OF α,α'-BIS(CHLOROMETHYL)-β-PROPIO-LACTONE, Vysokomolekul. Soedin. Geterotsepnye Vysokomolekul. Soedin. 1964, 236; C. A. 61, 7110 (1964)

The polymers were degraded at  $300^{\circ}$  and the decomposition gases were measured in a gas buret. Decomposition is more rapid in air than in argon. The polymer is stable below  $250^{\circ}$ .

### POLYMERS AND RELATED COMPOUNDS CONTAINING ACID AND ESTER GROUPS

### Polycarbonates

#### Ref. No.

G. Peilstocker, THE TEMPERATURE BEHAVIOR OF POLYCARBONATE, British Plastics 35, 365 (1962)

Various properties were studied as a function of temperature up to the decomposition temperature.

325 L. Huang Lee, STABILIZATION OF POLYCARBONATES, Am. Chem. Soc., Div. Org. Coatings, Plastic Chem., Preprints <u>22</u> (2), 131 (1962); C. A. 61, 779 (1964)

Since polycarbonates become unstable above 300°, the various modes of degradation (hydrolysis, oxidation, chain scission) were studied. Possible mechanisms are postulated.

M. Tomikawa, POLYCARBONATES. II. DECOMPOSITION OF POLYCARBONATES, Kobunshi Kogaku 20 (213), 11 (1963); C. A. 61, 1941 (1964)

Studied thermal decomposition and hydrolysis. The products evolved were determined.

A. Davis and J. H. Golden, DEGRADATION OF POLYCARBONATES. III. VISCO-METRIC STUDY OF THERMALLY INDUCED CHAIN SCISSION, Proc. Battelle Symp. Thermal Stability Polymers, Columbus, Ohio 1963, L1; C. A. 60, 9375 (1964)

Thermal degradation of polycarbonates in vacuum without cross-linking or depolymerization was studied to determine changes in molecular weight (viscosity) and the extent of chain scission.

- B. M. Kovarskaya, M. S. Akutin, A. I. Sidnev, M. P. Yazvikova, and M. B. Neiman, THERMOCKIDATIVE DEGRADATION OF POLYCARBONATES, Vysokcmolekul. Soedin. 5 (5), 649 (1963)

- R. T. Conley, OXIDATIO'S STUDIES ON ACRYLIC POLYMERS, Proc. Battelle Symp. Thermal Stability Polymers, Columbus, Ohio 1963, J1; C. A. 60, 10816 (1964)

Mechanisms for the thermal oxidative degradation of polyacrylonitrile and poly(ethyl acrylate) were studied. Infrared and gas chromatographic methods were used.

# Poly(ethylene terephthalate)

R. M. Schulken, Jr., R. E. Boy, Jr., and R. H. Cox, DIFFERENTIAL THER-MAL ANALYSIS OF LINEAR POLYESTERS, J. Polymer Sci. C6, 17

DTA was used to measure crystallization, melting, and glass transition temperatures of poly(ethylene terephthalate), poly(1,4-cyclohexylenedimethylene terephthalate), and some co-polyesters. DTA was also used to study the stability of these polymers to thermal and oxidative degradation.

353 H. Sobue and A. Kajiura, EFFECT OF HEATING ON POLY(ETHYLENE TEREPHTHA-LATE), Kogyo Kagaku Zasshi 62, 1766 (1959); C. A. 57, 13986 (1962)

Toly(ethylene terephthalate) was heated at 180-280° under vacuum. The evolved gases were studied by mass spectrometry, infrared spectroscopy and gas chromatography.

H. Zimmermann, CHEMICAL STUDIES ON FIBER-FORMING POLYESTERS. I. THERMAL STABILIZATION OF POLY(ETHYLENE TEREPHTHALATE), Faserforsch. Textiltech. 13, 481 (1962); C. A. 58, 14211 (1963)

The effects of catalyst used in the preparation on the polymerization rate and thermal decomposition of the polymer were studied.

N. V. Mikhailov, L. G. Tokareva, K. K. Buravchenko, G. M. Terekhova, and P. A. Kirpichnikov, STABILIZATION OF POLY(ETHYLENE TEREPHTHALATE) MELTS, Vysokomolekul. Soedin. 4, 1186 (1962)

The initial stage of the thermal oxidation of poly(ethylene terephthalate) was studied at  $170^{\circ}$ ,  $200^{\circ}$  and  $210^{\circ}$ C.

Bacon Ke, DIFFERENTIAL THERMAL ANALYSIS OF HIGH POLYMERS. IV. SATURATED LINEAR POLYESTERS, J. Applied Polymer Sci. 6, 624 (1962)

DTA was used for the systematic investigation of poly(ethylene terephthalate) and related materials.

M. Mikhailov and E. Novakov, IMPROVING THE THERMAL STABILITY OF POLY (ETHYLENE TEREPHTHALATE) BY FUSION WITH ADDITIVES, Khim. i Ind. (Sofia) 35 (4), 137 (1963); C. A. 60, 6991 (1964)

# Poly(ethylene terephthalate) - continued

#### Ref. No.

Z. Zamorsky, KINETICS OF THE THERMAL DEGRADATION OF POLY(ETHYLENE TEREPHTHALATE) AND ITS COPOLYMERS WITH ETHYLENE ISOPHTHALATE, Faserforsch. Textiltech. 14 (7), 271 (1963); C. A. 60, 3120 (1964)

The time dependence of viscosity was studied. The degradation of a 90/10 ethylene terephthalate/ethylene isophthalate copolymer was less in the  $<270^{\circ}$  temperature range than that of pure poly(ethylene terephthalate).

- G. M. Terekhova, N. V. Mikhailov, and L. G. Tokareva, THERMAL STABILITY OF POLY(ETHYLENE TEREPHTHALATE) (PET) CONTAINING PHOSPHOROUS ACID ESTERS, Khim. Volokna 1964 (4), 33; C. A. 61, 13480 (1964)
- 360 I. Kurlyama, K. Tomita, and K. Shirakashi, ANOMALOUS THERMAL EXPANSION OF POLY(ETHYLENE TEREPHTHALATE), Kobunshi Kagaku 21 (234), 584 (1964); C. A. 62, 5350 (1965)

Studied effects of cooling, melting temperature, and melting time on the thermal expansion, specific heat, and DTA of a poly(ethylene terephthalate) sample melted in vacuum.

I. E. Kardash, A. N. Pravednikov, and S. S. Medvedev, THERMAL DEGRADA-TION OF POLY(ETHYLENE TEREPHTHALATE), Dokl. Akad. Nauk SSSR 156 (3), 658 (1964); C. A. 61, 7128 (1964)

Degradation was carried out under vacuum and the process was followed viscometrically. Analysis of decomposition products is reported. A random mechanism of degradation is reported.

M. A. Hughes and R. P. Sheldon, SOME THERMAL STUDIES ON POLY(ETHYLENE TEREPHTHALATE), J. Applied Polymer Sci. 8, 1541 (1964)

DTA and TGA studies were carried out on samples of amorphous cold-drawn, heat-crystallized, and acetone-crystallized polymer. Some observations regarding the crystallization process, as followed by DTA, are recorded. The TGA gave evidence that a high temperature endothermic peak observed in DTA may not be directly associated with depolymerization.

P. R. Blakey and R. P. Sheldon, COLD-DRAWING AND CRYSTALLIZATION OF POLYETHYLENE TEREPHTHALATE, Polymer 6, No. 2, 107 (1965)

DTA was used to study crystallization of the title polymer.

### Poly(isopropyl methacrylate)

364 C. J. Noel, THE THERMAL DEGRADATION OF POLY(ISOFROPYL METHACRYLATE), Am. Chem. Soc., Div. Polymer Chem., Preprints 4 (1), 378 (1963), C. A. 62, 657 (1965)

The degradation was studied by using a temperature-programmed apparatus which follows the appearance of volatile degradation

# Poly(isopropyl methacrylate) - continued

#### Ref. No.

products by thermal conductivity measurements (thermo-volatilimetric analysis, TVA). TVA curves were also obtained for poly(methacrylic anhydride), poly(isopropyl acrylate), poly(sec-butyl methacrylate) and poly(cyclohexyl methacrylate).

# Poly(methyl methacrylate)

P. I. Levin, DECOMPOSITION OF POLY(METHYL METHACRYLATE) AT DIFFERENT DIGESTION TEMPERATURES, Plasticheskie Massy 1959, No. 3, 29; C. A. 58, 8053 (1963)

Investigated the change in the concentration of monomer in poly(methyl methacrylate) on varying the temperature and time of heating. Kinetic data are reported.

- S. A. Arzhakov, E. E. Rylov, G. L. Slonimskii, and B. P. Shtarkman, THERMAL DESTRUCTION IN PRESSURE MOLDING OF A UNIFORM SOLID FROM POLY-(METHYL METHACRYLATE) PCWDER, Dokl. Akad. Nauk SSSR 145, 595 (1962); C. A. 57, 16865 (1962)
- 367 S. N. Zhurkov and S. A. Abasov, RELATION BETWEEN MECHANICAL STRENGTH AND THERMAL DEGRADATION OF POLYMERS. III., Vysokomolekul. Soedin. 4, 1703 (1962)

Times to breakdown of poly(methyl methacrylate) film, poly(vinyl chloride) fibers, isotactic polypropylene fibers, polystyrene fibers and sheets, and poly(tetrafluoroethylene) fibers were determined under various stretching stresses and at various temperatures.

A. Barlow, R. S. Lehrle and J. C. Robb, RATE OF THERMAL DEGRADATION OF THIN POLYMER FILMS. CHOICE OF SAMPLE THICKNESS TO ELIMINATE THE EFFECTS OF DIFFUSION AND TEMPERATURE GRADIENT, Makromol. Chem. 54, 230 (1962)

Studied the rate of degradation of thin films of poly(methyl methacrylate) as a function of sample thickness.

J. R. MacCallum, KINETICS OF CHAIN-END INITIATED DEGRADATION OF POLYMERS, Trans. Faraday Soc. <u>59</u>, 2099 (1963)

The kinetics of chain-end-initiated degradation of polymers is formulated and applied to available data on poly(methyl methacrylate).

The kinetics of thermal depolymerization of  $\alpha$ -poly(oxymethylene) was studied by measuring the rate of increase in the pressure of evolved HCHO.

394 A. I. Yakubchik and V. S. Shagov, STABILITY OF POLYALDEHYDES, Zh. Prikl. Khim. 36 (7), 1584 (1963); C. A. 59, 15398 (1963)

The thermal stability of amorphous and crystalline polyacetaldehyde (I), poly(trichloroacetaldehyde) (II), and poly(hexahydrobenzaldehyde) (III) was studied by measuring weight loss at 100° using a torsion balance. The rate of degradation decreases with increasing degree of crystallinity. The thermal stability increases in the order III> II> I. The weight loss of the most stable III is 4.0% after 0.5 hour, and 6.3% after 3 hours.

H. P. Frank, THE DEPOLYMERIZATION OF CRYSTALLINE POLYISOBUTYRALDEHYDE, Makromol. Chem. 63, 135 (1963)

The kinetics of depolymerization to monomer were studied under vacuum between 50 and  $130^{\circ}$ .

J. Mejzlik, J. Pac and L. Janeckova, THERMO-OXIDATIVE STABILIZATION OF POLYFORMALDEHYDE, Chem. Prumysl 13 (38), No. 12, 658 (1963); C. A. 60, 5705 (1964)

Tested about 60 stabilizers for polyformaldehyde with acetate end groups. Evaluation was carried out by exposing the sample at 222°C in an automatic balance and by measurement of weight loss and of the molecular weight on degrading the polymer in air at 90°C.

V. R. Alishoev, M. B. Neiman, B. M. K. kaya and V. V. Gut'yanova, THERMOOXIDATIVE DEGRADATION AND STABILIZATION OF POLYFORMALDEHYDE, Vysokomolekul. Soedin. 5 (5), 644 (1963)

Reports that the products of thermooxidative degradation of polyformaldehyde are HCHO, C oxides, hydrogen and water. Various anti-oxidants were tested.

The thermal degradation of unstabilized and stabilized polyformaldehyde was studied by heating thin tablets of polymer. It was found that the difference in the degradation rates of the stabilized and nonstabilized polymers is determined only by the activation energies.

L. A. Dudina and N. S. Enikolopyan, THERMAL AND THERMOOXIDATIVE DEGRA-DATION OF POLYFORMALDEHYDE. I. ORDER OF THE THERMAL DEGRADATION RE-ACTION, Vysokomolekul. Soedin. <u>5</u> (6), 861 (1963)

The mechanism and kinetics of thermal degradation were investigated by manometric measurement of evolved gases. The only gaseous product was formaldehyde and the degradation reaction is first order.

L. A. Dudina, L. V. Karmilova, and N. S. Enikolopyan, CVTDATIVE DESTRUCTION OF POLYFORMALDEHYDE, Dokl. Akad. Nauk SSSR 150 ,09 (1963); C. A. 59, 4055 (1963)

The pyrolysis of polyformaldehyde containing hydroxyl and acetate terminal groups was studied in the range 180-185° in the presence of oxygen.

L. A. Dudina, L. A. Agayants, L. V. Karmilova and N. S. Enikolopyan, THERMAL AND THERMOOXIDATIVE DEGRADATION OF POLYFORMALDERYDE. V. Fermic Acid Role in Thermoexidative Degradation, Vysckomolekul. Soedin. 5 (8), 1245 (1763)

Degradation of stabilized polyformaldehyde was carried out in the presence of formic acid in an inert atmosphere, in an oxygen atmosphere, and under pressure. The rate of degradation was greater in the presence of oxygen and formic acid than in the presence of oxygen alone. Formic acid did not accelerate the rate of degradation in an inert atmosphere. The results indicate a catalytic action of formic acid in the oxidation of the end groups of the broken polymer chains.

- W. M. Jackson and R. T. Conley, HIGH TEMPERATURE OXIDATIVE DEGRADATION OF PHENOL-FORMALDEHYDE POLYCONDENSATES, J. Applied Polymer Sci. 8, 2163 (1964)

The degradation of phenol-formaldehyde polycondensates was investigated at temperatures as high as 1000°C. By employing infrared spectrophotometric techniques and vapor-ohase chromatographic methods, as well as thermogravimetric and x-ray analyses, it was possible to examine the oxidation chemistry of this resin system. It was found that the primary degradation route of phenol-formaldehyde polycondensates, regardless of whether the resin is exposed to elevated temperatures in air, argon, or mitrogen, is oxidation. At elevated temperatures, products are observed from thermal pyrolysis in addition to those from the oxidation path. However, throughout the temperature region studied, the oxidative degradation is always more pronounced. In this study, it was found that phenol-formaldehyde polycondensates of unusual thermal stability could be produced by high temperature postcuring. The comparison of the oxidation rates of the resin cured at low temperature and this material indicates greatly improved oxidative stability, as well as resistance to thermal pyrolysis. This undoubtedly is due to the complete crosslinking of the resin system.

A poly(m-phenoxylene) showed 3% weight loss up to 500°. Methods of kinetic analysis of TGA data are illustrated with octamethylcyclotetrasiloxane and polytetrafluoroethylene.

S. M. Cohen, C. F. Hunt, R. E. Kass, and A. H. Markhart, POLYSPIROACETAL RESINS. PART II. STRUCTURE AND PROPERTIES OF POLYSPIROACETALS FROM PENTAERYTHRITOL-GLUTARALDEHYDE AND FROM (PENTAERYTHRITOL-DIPENTAERYTHRITCL)-(GLUTARALDEHYDE), J. Applied Polymer Sci. 6, 508 (1962)

Because of the general oxidative instability of many aliphatic or alicyclic ethers at elevated temperatures, the demonstrated improvement in thermal stability by these polyspiroacetals points in part to the contribution of the spirane neopentyl carbons. Films crosslinked with pyromellitic dianhydride exhibited good flexibility and tensile strength. Moreover, their oxidative thermal stability was only slightly less than that of crosslinked poly(ethylene terephthalate).

POLYMERIC MATERIALS FROM CONDENSATION PRODUCTS OF THE ALICYCLIC
KETONES WITH ALDEHYDES. SYNTHESIS AND INVESTIGATION OF THE POLYETHERS FROM 2,2,6,6-TETRAKIS(HYDROXYMETHYL)CYCLOHEXANOL AND 2,2,5,5TETRAKIS(HYDROXYMETHYL)CYCLOPENTANONE, Plasticheskie Massy 1963 (6),
18; C. A. 59, 10300 (1963)

The resins were used as adhesives for glass. The joints were resistant against prolonged boiling in water and to temperatures of 250-300°.

N. Grassie and J. N. Hay, THERMAL DEGRADATION OF POLY(METHYL VINYL KETONE) AND ITS COPOLYMERS WITH ACRYLONITRILE, Makromol. Chem. 64, 82 (1963)

Thermal degradation of poly(methyl vinyl ketone) is a function of the elimination of water and the production of a colored conjugated structure. The changes produced in the infrared spectra are shown. Methyl vinyl ketone produces an acceleration in the rate of condensation of nitrile groups in polyacrylonitrile.

Several polymers were prepared and TGA curves are shown.

R. T. Foster and C. S. Marvel, POLYBENZIMIDAZOLES. IV. POLYBENZIMIDA-ZOLES CONTAINING ARYL ETHER LINKAGES, J. Polymer Sci. A3, 417 (1965)

Several polymers were prepared and their thermal stabilities were studied.

#### Polybenzoxazoles

T. Kubota and R. Nakanishi, PREPARATION OF FULLY AROMATIC POLYBENZOXA-ZOLES, J. Polymer Sci. <u>B2</u>, 655 (1964)

TGA was used to assess thermal stability in nitrogen and in air. Decomposition started at about  $500^{\circ}$ C in air. When heaved to  $900^{\circ}$ C in a nitrogen atmosphere, the weight loss was about 27% compared to 35% in air.

# Poly(caprolactam)

V. V. Savarenskii, DETERMINATION OF TEMPERATURE LIMITS IN UTILIZATION OF POLYMERIC MATERIALS FOR MACHINE PARTS, Plasticheskie Massy 1963 (6), 65; C. A. 59, 7716 (1963)

Heat resistance of poly(c-caprolactam) and of poly(vinyl chloride) estimated by measurement of dielectric constant at increasing temperatures. The same relations were found between the temperature changes of both dielectric constant and mechanical properties, as they are induced by the same structure changes.

### Polyester-Urethanes

J. H. Engel, Jr., S. L. Reegen and P. Weiss, EFFECT OF STRUCTURE ON TEMPERATURE STABILITY AND SOLUPPLITY OF POLYESTER-URETHANES, J. Polymer Sci. 7, 1679 (1963)

Data obtained from isotherms: heat aging and TGA, both carr ed out in air and in inert atmosphere, indicate that thermal stability increases with increasing ester/urethane ratio and is independent of crosslinking density where the ester/urethane ratio is held constant. In addition, data obtained from heat aging and TGA indicated that decomposition of the samples occurs as rapidly in inert atmosphere as

### Polyester-Urethanes - continued

## Ref. No.

in air, indicating that the decomposition occurs chiefly by a non-oxidative mechanism.

### Polyimides

J. I. Jones, F. W. Ochynski and F. A. Rackley, POLYPYROMELLITIMIDES: A NEW CLASS OF THERMALLY STABLE POLYMERS, Chem. Ind. 1962, 1686

Differential thermogravimetric curves are shown for several of the polymers when heated in air and in argon.

520 L. W. Frost and G. M. Bower, AROMATIC POLYIMIDES, Am. Chem. Soc., Div. Polymer Chem., Preprints 4 (1), 357 (1963); C. A. 62, 641 (1965)

Several polyimide polymers suffered less than 10% weight loss after aging for 400 hours at  $325^{\circ}$  in air.

521 G. M. Bower and L. W. Frost, AROMATIC POLYIMIDES, J. Polymer Sci. Al., 3135 (1963)

Several of the polymers in the form of films suffered less than 10% weight loss after aging 400 hours at 325°C. in air.

522 S. Nishizaki and A. Fukami, DIFFERENTIAL THERMAL ANALYSIS OF LINEAR POLYIMIDES, Kogyo Kagaku Zasshi 66 (3), 382 (1963); C. A. 59, 11673 (1963)

DTA showed that aromatic polyimides decompose above  $400^{\circ}$  in nitrogen. Polyimides with connections at the para positions of aromatic diamine nuclei have higher decomposition temperatures than those connected at the meta positions. Thermal oxidative degradation at the CH<sub>2</sub> groups in the main chain and decomposition at methyl groups in the side chain occur at  $200\text{--}300^{\circ}$  in air. Ether linkages between aromatic nuclei in diamine units are stable.

523 Anon., POLYIMIDE PLASTICS FOR USE TO 570°F, Mater. Design Eng. <u>57</u>, No. 1, 145,147 (1963)

It is reported that polyimide resins maintain 90% of their tensile strength after 1000 hours of exposure to air at 570°F.

I. P. Zhuravleva, E. A. Zgadzai, and A. I. Maklakov, SOME PROPERTIES OF POLY(PHENYLENIMINE), Vysokomolekul. Soedin. 6 (3), 488 (1964)

Included is a study of weight loss of the title polymer on heating in vacuum and in air.

P. M. Hergenrother, Wolfgang J. Wrasidlo, and H. H. Levine, HIGH-TEMPERA-TURE STRUCTURAL ADHESIVES, 116 pp. (1964), AD 502679, Avail. OTS; C. A. 62, 696 (1965)

> Polyimides, polybenzothiazoles, polyquinoxalines and polythiazolothiazoles were studied. Some TGA results are reported.

## Polyimides - continued

### Ref. No.

A. D. Mair, M. C. Shen, and A. V. Tobolsky, HIGH-TEMPERATURE POLYMERS: H-FILM AND SP-POLYMER, 13 pp. (1964), AD 604010, Avail. OTS; C. A. 62, 4165 (1965)

Studied a family of polyimides stable up to  $400^{\circ}$  in air. They show no glass transition and no melting point up to  $500^{\circ}$ .

527 S. Nishizaki and A. Tukami, THERMAL DEGRADATION OF POLYPYROMELLITIMIDES, Kogyo Kagaku Zasshi 67 (3), 474 (1964); C. A. 16181(1964)

Studied thermal degradation up to  $600^{\rm O}$  in nitrogen and in air by TGA analysis and infrared absorption spectra.

528 S. D. Bruck, THERMAL DEGRADATION OF AN AROMATIC POLYPYROMELLITIMIDE IN AIR AND VACUUM I - RATES AND ACTIVATION ENERGIES, Polymer 5, No. 9, 435 (1964)

The thermal degradation of a polypyromellitimide (condensation product of pyromellitic anhydride and an aromatic diamine) was studied in air and vacuum in the range of 400° to 706° by TGA. This polymer is stable in air up to approximately 420°C, but at 485°C practically total volatilization takes place within about 5 hours. Under vacuum, the polymer shows no appreciable weight loss even after prolonged exposure to temperatures up to approximately 500°C. Above t is temperature it begins to volatilize leaving a brittle, carbonized residue which appears to reach a limiting weight corresponding to approximately 45% of the original sample.

529 S. D. Bruck, THERMAL DEGRADATION OF AN AROMATIC POLYPYROMELLITIMIDE IN AIR AND VACUUM II - THE EFFECT OF IMPURITIES AND THE NATURE OF DEGRADATION PRODUCTS, Polymer 6, 1, 49 (1965)

Purification of the polymer in dimethylformamide decreases rates of degradation both in air and vacuum, but only slightly reduces activation energies. Infrared and mass spectrometric data suggest participation of polypyromellitamic acid impurity in the degradation.

L. C. Scala and W. M. Hickam, THE BEHAVIOR OF POLYPYROMELLITIMIDE RESINS AT HIGH TEMPERATURES, J. Applied Polymer Sci. 9, 213 (1965)

### Polyoxadiazoles

Y. Iwakura, K. Uno and S. Hara, POLY-1,3,4-OXADIAZOLES, I. POLYPHENYLENE-1,3,4-OXADIZOLES, J. Polymer Sci. A3, 45 (1965)

TGA curves are shown. For both poly-(p-phenylene-1,3,4-oxadiazole) and poly-(m-phenylene-1,3,4-oxadiazole) only minor weight loss was observed below  $450^{\circ}$ C in air, and an abrupt weight loss occurred above  $450^{\circ}$ C.

## **Polyphenylpyrozoles**

#### Ref. No.

J. P. Schaefer and J. L. Bertram, THERMALLY STABLE POLYMERS. I. POLY-PHENYLPYRAZOLES, J. Polymer Sci. B3, 95 (1965)

A TGA curve is shown. No weight loss was observed up to 400°.

### Polyphthalocyanines

A. A. Berlin, L. G. Cherkashina, E. L. Frankevich, E. M. Balabanov and Yu. G. Aseev, POLYMERS WITH A CONJUGATED BOND SYSTEM L. SYNTHESES AND STUDY OF THE ELECTROPHYSICAL PROPERTIES OF POLYMERIC PHTHALOCYANINES, Vysokomolekul Soedin. 6 (5) 832 (1964)

A study of the thermal stability of polyphthalocyanines is described. Polymers that during treatment underwent hydrolysis of the nitrile groups break down in air as a rule at higher temperatures  $(300-350^{\circ})$  than the nitrile containing analogs  $(250^{\circ})$ .

## Polyquinoxalines

Gabriel de Gaudemaris, B. Sillion, and J. Preve, HEAT-STABLE POLYMERS.

I. POLYQUINOXALINES, Bull. Soc. Chim. France 1964 (8), 1793; C. A.
62, 1757 (1965)

Thermal stability was studied by using pressed polymer pellets in argon at  $400-650^{\circ}$  and in air at  $300-550^{\circ}$ . There was no detectable weight loss below  $450^{\circ}$  in argon or at  $350-450^{\circ}$  in air.

J. K. Stille and J. R. Williamson, POLYQUINOXALINES, J. Polymer Sci. A2, 3867 (1964)

TGA in air and nitrogen was carried out. These polymers are stable in air to  $500^{\circ}\text{C}$  and under nitrogen lose only 20% of their weight at  $800^{\circ}\text{C}$ .

G. P. de Gaudemaris and B. J. Sillion, NEW POLYMERS OBTAINED BY POLY-HETEROCYCLIZATION: POLYQUINOXALINES, J. Polymer Sci. <u>B2</u>, 203 (1964)

Some TGA results are included.

J. K. Stille and J. R. Williamson, POLYQUINOXALINES, J. Polymer Sci. B2, 209 (1964)

TGA shows that the quinoxaline polymers have thermal stabilities in air and nitrogen which are comparable to the polybenzimidazoles. Temperatures are reported at which the polymer had lost 20% of its weight under nitrogen, and at which the break in the curve occurred in air.

#### Polythiazole

J. M. Craven and T. M. Fischer, Jr., FILM-FORMING POLYTHIAZOLES, J. Polymer Sci. <u>B3</u>, 35 (1965)

Weight losses for two polythiazoles are reported between 320 and  $700^{\circ}\text{C}$  in air and under helium.

## Polyurethanes

### Ref. No.

P. E. Slade, Jr. and L. T. Jenkins, THERMAL ANALYSIS OF POLYURETHANE ELASTOMERS, J. Polymer Sci. <u>C6</u>, 27

Differential thermal analysis and thermogravimetric analysis were used to evaluate the thermal properties of several types of polyure-thane elastomers. The decomposition of polymers made with 4,4'-diphenylmethane diisocyanate (MDI) occurred above 490°C and was at least a two-step process, while the decomposition of polymers containing toluene diisocyanate (TDI) occurred below 400°C and appeared to be a one-step reaction.

540 C. M. Cusano, E. P. Dunigan and P. Weiss, POLYESTER-URETHANE BLOCK TER-POLYMERS, J. Polymer Sci. C., No. 4, Part 1, 743 (1963)

The heat stability of the block terpolymers was investigated by TGA in air and by heat aging at 250°C for 20, 40 and 60 minutes. Indices (ipdt) of thermal stability are reported.

H. C. Beachell and C. P. Ngoc Son, COLOR FORMATION IN POLYURETHANES, J. Applied Polymer Sci. 7, 2217 (1963)

> The pyrolysis of a polyurethane obtained from tolylene 2,4-diisocyanate and ethylene glycol was studied in nitrogen, air, and oxygen from the point of view of structural change and color formation. Some products of degradation are described.

- E. N. Walsh, E. N. Uhing, and T. M. Beck, FLAME-RETARDANT POLYURETHAN AND POLYESTER RESINS, Am. Chem. Soc. Div. Org. Coatings, Plastics Chem., Preprints 23 (1), 1 (1963); C. A. 62, 699 (1965)
- R. C. Nametz, R. D. Deanin, and P. M. Lambert, FLAME-RESISTANT RIGID POLYURETHAN FOAMS FROM MONOBROMINATED TOLYLENE DIISOCYANATE, Am. Chem. Soc. Div. Org. Coatings, Plastics Chem.. Preprints 23 (1), 126 (1963); C. A. 62, 699 (1965)
- J. J. Anderson, RETENTION OF FLAME PROPERTIES OF RIGID POLYURETHAN FOAMS, Ind. Eng. Chem., Prod. Res. Develop. 2 (4), 260 (1963)

Studied the effect of various chemical and physical factors on the retention of initial flame resistance. Excellent permanency of flame resistance was furnished by the reactive-type agent as compared with physical additives.

J. D. Ingham and N. S. Rapp, POLYMER DEGRADATION. II. MECHANISM OF THER-MAL DEGRADATION OF POLYOXYPROPYLENE GLYCOL-TOLUENE 2,4-DIISOCYANATE POLYMER (POPG-TDI) AND A BLOCK POLYETHER GLYCOL-TDI POLYMER, J. Polymer Sci. A2, 4941 (1964)

Degradation was studied under vacuum. At temperatures of ~200°C the predominant degradation involves random scission of urethane linkages to give considerable amounts of isocyanate and hydroxyl. Kinetic data suggests that the weakest links in POPG-TDI polymer are spaced at intervals of 210,000 in molecular weight and that they may be eliminated by pretreatment of the POPG with ethylene oxide to form a block copolyether which is used to prepare the polyurethane. Above 250°C the kinetics of degradation of POPG-TDI are similar to the results for POPG and indicate scission of polyether bonds by a combination of intra-molecular proton abstraction and free radical unzipping reactions, in agreement with previous studies of POPG of much higher molecular weight.

#### Miscellaneous - Continued

### Ref. No.

Three new benzborimidazoline polymers were prepared by condensation of aromatic diboronic acid derivatives and 3,3'-diaminobenzidine. Polymers prepared from benzene diboronic esters showed good thermal stability (TGA) up to  $500\text{-}600^{\circ}\text{C}$ . A polymer prepared from ferrocene diboronic acid or ester began to decompose extensively between 300 and  $400^{\circ}\text{C}$ .

B. H. Clampitt and A. P. Mueller, POLYMERIZATION OF 2,4,6-TRIALLYLOXY-PYRIMIDINE, J. Polymer Sci. 62, 15 (1962)

The preparation of triallyloxypycimidine is described, together with the polymerization characteristics of this compound under DTA conditions. The DTA curves show a doublet first exotherm near 100°C., and a singlet exotherm at 225°C. Combining the heat values obtained from the DTA curves with infrared spectral data indicates that the complex first exotherm represents a total polymerization of two allyl groups, while the second exotherm involves rearrangement to the barbiturate structure.

### Ref. No.

H. C. Beachell and C. P. NGOC SON, THERMAL DEGRADATION OF ETHYLENE BIS-(N-PHENYLCARBAMATE), J. Polymer Sci. A2, 4773 (1964)

The pyrolysis of the title compound was studied as the simplest model of a polyurethane. Products of degradation were identified by elemental analysis, infrared spectra and mixed melting point. A mechanism of degradation is proposed. Studies were made under nitrogen. .t approximately 200-450°C.

G. F. L. Ehlers and J. D. Ray, SYNTHESIS AND CHARACTERIZATION OF POLY-S-TRIAZINYLENFIMIDES, J. Polymer Sci. Az., +989 (1964)

TGA and DTA studies were made under nitrogen. The major thermal breakdown of most of these polymers (inversion point of the TGA curve) occurs around 450°C. Chlorine-containing polymers lose some weight at fairly low temperatures, but retain more weight at high temperatures.

F. Dawans, B. Reichel and C. S. Marvel, 2,7-DISUBSTITUTED 1,3,6,8-TETRAAZOPYRENE AND RELATED POLYMERS, J. Polymer Sci. A2, 5005 (1964)

TGA, in nitrogen and in air, was used. It appears that these new polymers are slightly less thermally stable than aromatic polybenzimidazoles in nitrogen or air, based on the starting temperatures of decomposition.

E. Dyer and R. J. Hammond, THERMAL DEGRADATION OF N-SUBSTITUTED POLY-CARBAMATES, J. Polymer Sci. A2, 1 (1964)

The initial rates of thermal degradation of these polymers and of unsubstituted analogs were determined at 230-285°C by following the evolution of carbon dioxide. The results (based on overall activation energy) showed that polymers derived from the substituted aliphatic diamines were more thermally stable than those derived from aromatic diamines. The low thermal stability was shown to be caused by amine endgroups. Some evidence as to modes of thermal degradation was obtained from a study of volatile products.

565 S. S. Stivala, G. R. Sacco, and L. Reich, POLYMERS CONTAINING AZULENE. I. POLY-SCHIFF BASES, J. Polymer Sci. <u>B2</u>, 943 (1964)

TGA indicated that a number of Poly-Schiff bases containing azulene showed good thermal stability (in vacuum) up to  $400^{\circ}$ C, but above this temperature there is rapid degradation. Arbitrary thermal stability indices (ipdt) are reported.

A. H. Frazer W. Sweeny, and F. T. Wallenberger, POLY(1,3,4-OXADIAZOLES):
A NEW CLASS OF POLYMERS BY CYCLODEHYDRATION OF FOLYHYDRAZIDES, J. Polymer Sci. A2, 1157 (1964)

TGA was used to assess the thermal stability of poly(1,3,4-oxadiczoles). Aromatic poly(1,3,4-oxadiazoles) were found to decompose

## Miscellaneous - continued

## Ref. N..

between 450 and  $500^{\circ}$ C. Aliphatic polyoxadiazoles degrade in the range  $400\text{-}450^{\circ}$ C.

A. H. Frazer and F. T. Wallenberger, POLY(1,3,4-OXADIAZOLE) FIBERS: NEW FIBERS WITH SUPERIOR HIGH TEMPERATURE RESISTANCE, J. Polyme Sci. A2, 1171 (1964)

Found that all-aromatic bulk polymer was thermally stable up to  $450^{\circ}$ C and decomposed at  $500^{\circ}$ C. Aliphatic poly(1,3,4-oxadiazoles) were found to degrade at  $400-450^{\circ}$ C.

A. F. Nikolaev and V. M. Bondarenko, POLY(VINYLAMINE) AND ITS DERIVATIVES. I. REACTION OF POLY(VINYLAMINE) WITH BENZALDEHYDE, SALICYL-ALDEHYDE, AND FURFURAL, Vysokomolekul. Soedin. 6 (10), 1825 (1964); C. A. 62, 2840 (1965)

Data are given on the thermal stability of the polymers resulting from the reactions.

A. A. Berlin, B. I. Liogon'kii, and V. P. Parini, 4,4'-BISDIAZONIOBI-PHENYL DIFLUORO POLYMERS, Vysokomolekul. Soedin., Geterotsepnye Vysokomolekul. Soedin. 1964, 134; C. A. 61, 9593 (1964)

Weight loss data are reported for heating the polymers in air and in nitrogen. Data are also reported showing the deformation of the polymers as a result of the combined action of pressure and temperature (up to  $480^{\circ}$ ).

A. A. Berlin, B. I. Liogon'kii and V. P. Parini, POLYMERS WITH A CON-JUGATED SYSTEM. LVI. SYNTHESIS AND PROPERTIES OF THE POLYMER BASED ON BIS(NITROSOACETYL)BENZIDINE, Izv. Akad. Nauk SSSR, Ser. Khim. 1964 (4), 705; C. A. 61, 5797 (1964)

Describes preparation of a polymer that decomposed at  $500^{\rm O}$  in air.

#### INORGANIC AND SEMI-INORGANIC SYSTEMS

### Boron containing polymers

J. Green, M. M. Fein, F. J. Loprest, A. Lum, and N. Mayes, THERMALLY STABLE BORON-CONTAINING POLYMERS, Proc. Battelle Symp. Thermal Stability Polymers, Columbus, Ohio 1963, RI; C. A. 60, 10789 (1964)

Polyesters of 2000 to 20,000 molecular weight were prepared by reaction of carborane diols and diacids with each other or with organic or fluorocarbon diacids and diols. Data on the thermal stability of a number of these polymers are reported.

N. A. Adrava, L. K. Prokhorova, and M. M. Koton, SYNTHESIS OF POLYMERS WITH DIBENZOBORIMIDAZOLINE LINKS IN THE MAIN CHAIN, Dokl. Akad. Nauk SSSR 158 (1), 130 (1964); C. A. 61, 16170 (1964)

## Boron containing polymers - continued

## Ref. No.

Some weight loss data at elevated temperatures are reported.

## Coordination and Chelate Polymers

J. B. Rust, HIGH-TEMPERATURE POLYMERS. I. TITANIUM AND ALUMINUM CHELATES, U. S. Dept. Com., Office Tech. Serv., <u>AD 262,701</u>, 51 pp. (1961); C. A. 58, 6979 (1963)

Studied mechanical properties of composites containing these chelates at room temperature and at  $500^{\circ}\text{F}$ .

T. W. Campbell and E. A. Tomic, POLYTHIOSEMICARBAZIDES. I. PREPARATION AND PROPERTIES OF THE POLYMERS AND SOME SIMPLE METALLIC CHELATES, J. Polymer Sci. 62, 379 (1962)

Wet-spun fibers of the polythiosemicarbazide decomposed in air at about  $205^{\circ}$ C. However, the copper-containing chelate fibers were stable in air up to about  $250\text{-}260^{\circ}$ C. Similar observations were made with the other chelates.

- 575 E. A. Tomic, THERMAL STABILITY OF COORDINATION POLYMERS, Am. Chem. Soc., Div. Polymer Chem., Preprints 4 (1), 237 (1963), C. A. 62, 659 (1965)
- A. P. Terent'ev, V. V. Rode, and E. G. Rukhadze, INVESTIGATION OF CHELATE POLYMERS. VII. CHELATE POLYMERS ON THE BASIS OF 2,6-DIACETYLPYRIDINE, Vysokomolekul. Soedin 5 (11), 1658 (1963)

Some thermal degradation studies of chelate polymers of nickel, cobalt and iron are reported.

777 R. G. Charles, METAL CHELATE POLYMERS DERIVED FROM TETRAACETYLETHANE, J. Polymer Sci. A1, 267 (1963)

TGA studies were made under argon. The heat stabilities of the polymeric materials appear to be of the same general magnitude as those of the structurally analogous metal acetylacetonates.

578 L. E. Mattison, M. S. Phipps, L. Alfred, S. Taylor, J. Thompson & B. Saul, COORDINATION COMPOUNDS OF p-NITROBENZENEAZOTYROSINE, J. Polymer Sci. A1, 3449 (1963)

Thermal analysis data showed that the bimetallic polymeric chelates have no exceptional stability. E.g., the decomposition range of a Zn (II)/Cu (II) is  $315-325^{\circ}C$ .

R. H. Horrocks and E. C. Winslow, OXINE-FORMALDEHYDE POLYMERS AND THEIR METALLIC CHELATES, J. Polymer Sci. <u>A1</u>, 3655 (1963)

Heat stability was determined by TGA and MTA. All samples began to lose weight at 270°C or below. The mode of decomposition of the polymer chelates appears to be independent of the metallic ion, but the free polymer is different. Its initial weight loss (between

### Coordination and Chelate Polymers - continued

## Ref. No.

270 and 320°C) is very gradual compared to the chelates. At 320°C it reverts to a form similar to that of the chelate. A second difference of the free polymer is that the rate of decomposition is a function of temperature, while that of the polymer chelates is not. The chelates may therefore hold interest in use as ablative materials. A third difference is that the free polymer melts beginning at about 190°C. The chelates do not melt.

E. C. Winslow and A. A. Manning, SALICYLALDEHYDE-FORMALDEHYDE POLYMERS AND THEIR METALLIC CHELATES, J. Polymer Sci. A2, 4903 (1964)

TGA studies are reported. Chelated polymers were stable in air at temperatures which were about  $50^{\circ}$ C higher than the decomposition temperature of the corresponding nonchelated polymers.

581 G. P. Brown and S. Aftergut, BIS(IMIDAZOLATO)-METAL POLYMERS, J. Polymer Sci. A2, 1839 (1964)

TGA revealed that the Co- and Zn-containing materials had unusually high thermal stability. No loss in weight could be detected below  $500-575^{\circ}\text{C}$  when heated in nitrogen.

582 A. H. Frazer and F. T. Wallenberger, METAL CHELATES OF POLYHYDRAZIDES, J. Polymer Sci. A2, 1825 (1964)

All the metal chelate fibers, irrespective of the nature of the metal ion used, decomposed rapidly (<1 hour) at temperatures in excess of  $350^{\circ}$ C.

V. M. Bondarenko, A. F. Nikolaev, and K. A. Makarov, POLY(VINYLAMINE)
AND ITS DERIVATIVES. II. CORRDINATION POLYMERS BASED ON POLY(N-SALI-CYLIDENEVINYLAMINE), Vysokomolekul. Soedin 6 (10), 1829 (1964)

Reports the thermal stability of the chelates in air as  $Cv^{++}>Co^{++}>Ni^{++}>Zn^{++}>Fe^{++}$ .

R. C. Degeiso, L. G. Donaruma, and E. A. Tomic, PREPARATION AND CHELAT-ING PROPERTIES OF 8-HYDROXYQUINOLINE-FORMALDEHYDE POLYMERS, J. Applied Polymer Sci. 9, 411 (1965)

Thermal degradation was studied for the unchelated polymer and for chelates of iron, aluminum, nickel and zinc.

### Glass Containing Systems

585 S. V. Glorioso, GLASS CLOTH-REINFORCED PLASTICS - ROOM AND ELEVATED TEMPERATURE PROPERTIES, U. S. Dept. Com., Office Tech. Serv., AD 286,329, 105 pp. (1959); C. A. 60, 9430 (1964)

Empirical data were obtained for establishing design criteria at room and elevated temperatures for various combinations of glass fabrics and resins.

## Glass Containing Systems - continued

#### Ref. No.

J. H. Freeman, E. J. Traynor, J. Miglarese and R. H. Lunn, GLASS-REIN-FORCED ORGANIC-RESIN LAMINATES FOR SERVICE TO 300°, SPE Tech. Papers 8, Session 8, Paper No. 2, 1 (1962); C. A. 57, 13985 (1962)

Aromatic polyamides and polyimides can be used as bonding agents in glass-reinforced laminated structures giving products that are useful as heat-resistant structural and insulating materials.

0. F. Shlenskii and M. P. Afinogenov, DETERMINATION OF SOME THERMOPHYSI-CAL PROPERTIES OF GLASS-RESIN LAMINATES IN THE TEMPERATURE RANGE 20-600°, Plasticheskie Massy 1962, No. 11, 53; C. A. 58, 9282 (1963)

The volumetric heat capacity and the density were measured for glass-resin laminates as a function of the heating intensity and the time of heating.

K. A. Andrianov and A. M. Chernyakova, STK 41, A GLASS FIBER-REINFORCED THERMALLY STABLE MATERIAL, Plasticheskie Massy 1963 (6), 21; C. A. 59, 14165 (1963)

Describes preparation of electrical insulators with high thermal stability, based on glass fiber reinforced poly(methylphenylsiloxane).

M. A. Denney and J. C. Martindale, PLASTICS IN AIRCRAFT. IV. TESTING OF REINFORCED PLASTICS AT ELEVATED TEMPERATURES, Aircraft Eng. 35, 10 (1963); C. A. 60, 5706 (1964)

Describes a test program for evaluation of the effect of temperature variation on the mechanical properties of reinforced plastics. The tests give design data from which, after prototype testing, the performance of aircraft components at elevated temperatures can be reliably predicted. Data are reported for polyester resin/glass cloth, epoxy resin/glass cloth, and phenolic resin/asbestos mat.

R. E. Rosensweig, THEORY FOR THE ABLATION OF FIBERGLAS-REINFORCED PHENOL-IC RESIN, AIAA (Am. Inst. Aeron. Astronaut.) J. 1 (8), 1802 (1963); C. A. 60, 5762 (1964)

A model is given for the stagnation-point ablation of a system consisting of a heterogeneous dispersion of C particles in glass. Ablation for this system approximates the dynamic ablation characteristics of fiberglas-reinforced phenolic resin materials.

## Iron Containing Polymers

A. A. Dulov, A. A. Slinkin, and A. M. Rubinshtein, ELECTRIC AND MAGNETIC PROPERTIES OF THERMALLY TREATED FERROCENE POLYMERS, Vysokomolekul. Soedin. 5 (10), 1441 (1963)

The polymers (as pressed disks) heated at  $200^{\circ}$  and  $270^{\circ}$  have semiconductor properties.

## Phosphorus Containing Polymers

## Ref. No.

J. R. Soulen and M. S. Silverman, POLYMERIZATION OF PHOSPHONITKILIC CHLORIDE TRIMER AT HIGH PRESSURES AND TEMPERATURES, J. Polymer Sci. A1, 823 (1963)

Thermal stability comparisons were made by TGA under nitrogen. There appears to be no difference in hydrolytic or thermal stability between elastomer formed under high pressure conditions and that obtained by the more usual polymerization at 1 atm.

V. V. Korshak, I. A. Gribova, and M. A. Andreeva, PHOSPHORUS-CONTAINING CURABLE RESINS, Plasticheskie Massy 1963 (16), 11; C. A. 60, 723 (1964)

The burning properties of a number of phosphorus containing resins (2.5-4.9% P) were investigated. All resins burned in a flame and only the halogen containing products were self-extinguishing.

V. I. Kirilovich, I. K. Rubtsova, and E. L. Gefter, PHOSPHORUS-CONTAIN-ING POLYESTERS OBTAINED BY TRANSESTERIFICATION OF DIALKYL PHOSPHITES AND HYDROXYL-CONTAINING COMPOUNDS, Plasticheskie Massy 1963 (7), 20; C. A. 59, 11674 (1963)

Polymers were prepared that were useful as fire-retardant additives to other compatible resins, especially after additional chlorination of the polymers.

### Ref. No.

Prepared two types of B-Si polymers. Type (A) was prepared by reaction of  $PhSi(OEt)_3$  with  $H_3BO_3$  in the molar ratio 1:1. Type (B) was prepared by reaction of a mixture of  $PhSi(OEt)_3$  and  $MeSi(Ph)(OEt)_2$  with  $H_3BO_3$  in the molar proportion 1.8:0.5:1.31. The weight loss after exposure to 350°C for 100 hours was 9.8% for (A) and 14.3% for (B). Weight loss after heat treatment at 600-800°C was 22% for (A) and 23.8% for (B). The weight loss was reduced by addition of Al powder.

TGA showed that a poly(p-phenylene sulfide) was stable both in air and nitrogen to  $400^{\circ}$ . At higher temperatures, a friable glass form: J which was stable to  $900^{\circ}$ .

5. Nishizaki and H. Kusakawa, PHYSICAL AND CHEMICAL PROPERTIES OF PY-ROLYZED ION-EXCHANGE RESINS, Kogyo Kagaku Zasshi 66 (6), 861 (1963); C. A. 60, 6938 (1964)

The free acid and Na salt of a highly acidic polystyrene cation-exchange resin were heat-treated at  $200\text{-}550^\circ$  under vacuum. The moisture absorption, infrared absorption spectra, electrical conductivity, and electron spin resonance spectra of the products were examined. The free SO<sub>3</sub> radical was decomposed at  $200^\circ$ , and the moisture absorbability of the product became low at this temperature, while SO<sub>3</sub> in the Na salt was stable up to  $400^\circ$ . The electrical conductivity was increased by the decomposition of SO<sub>3</sub>.

H. Q. Smith and F. L. Scott, POLYMERS FROM SULFAMIDE. I. PREPARATION J. Polymer Sci. A2, 481 (1964)

Sulfamide and formaldehyde react at pH 10 to give a polymeric white solid which decomposes at 234-235°C.

No significant improvement in thermal stability of the polymers was achieved.

R. A. Florentine, G. Barth-Webrenalp, I. Mockrin. I. Popoff and R. Riordan, POLYMERS FROM SULFAMIDE. II. EVALUATION AND STRUCTURE, J. Polymer Sci. A2, 489 (1964)

Acid- and base-catalyzed polymers involving sulfamide, melamine, and formaldehyde were prepared. The products are insoluble and their thermal stability does not exceed 225°C under nitrogen.

D. W. Thomson and Gerhard F. L. Ehlers, AROMATIC POLYSULFONATES: PREPARATION AND PROPERTIES, J. Polymer Sci. <u>A2</u>, 1051 (1964)

Thermal gravimetric analysis (TGA) in a nitrogen atmosphere was used to evaluate the thermal stability of the polysulfonates. A fairly sharp onset of weight loss is noted around 300°C, which levels

## Sulfur Containing Polymers = continued

### Ref. No.

off at  $500^{\circ}$ C, leaving approximately 50% residue up to  $900^{\circ}$ C. Since the majority of the polymers show loss of weight in the  $300\text{-}340^{\circ}$ C region, the upper limits of stability appear to be governed by the stability of the sulfonate linkage.

650 E. H. Hill and J. R. Caldwell, POLYSULFONES OF NORBORNENE AND DERIVATIVES, J. Polymer Sci. A2, 1251 (1964)

Thermal stabilities were determined by heating a weighed sample of the polymer in a test tube at 190°C and determining the weight loss due to the breakdown of the polymer into monomer and sulfur dioxide at intervals of 0.5, 1 and 3 hours. The stability can be improved by the addition of stabilizers which have been shown to be effective for other polysulfones.

Shigemitru Tsunawaki and C. C. Price, PREPARATION OF FOLY (ARYLENE SUL-FIDES), J. Polymer Sci. A2, 1511 (1964)

The weight loss of poly(phenylene sulfide) after heating for 1 hour at various temperatures up to  $600^{\circ}$ C under reduced pressure is reported. This polymer is seemingly stable up to  $500^{\circ}$ C but at  $600^{\circ}$ C some crosslinking may occur to give infusible, insoluble materials. After 2 hours at  $500^{\circ}$ C, the molecular weights of residue and sublimate indicated that only fractional distillation had occurred. Therefore, the weight loss at  $500^{\circ}$ C does not indicate thermal degradation.

A. H. Frazer, THERMAL STABILITY OF THE COPOLYMER OF SULFUR DIOXIDE AND CIS,CIS-1,5-CYCLOOCTADIENE, J. Polymer Sci. A2, 4031 (1964)

Degradation of this copolymer followed first-order kinetics at 220°C or above with random cleavage of the polymer chain. Pyrolysis of the copolymer up to 75% loss of weight gave the monomers as cracking products and in the mole ratio of the copolymer composition.

653 E. Wellisch, E. Gipstein, and Orville J. Sweeting, THERHAL DECOMPOSITION OF POLYSULFONES, J. Applied Polymer Sci. 8, 1623 (1964)

The thermal decomposition of  $C_4$ ,  $C_6$  and  $C_8$  poly(methylene sulnones) was investigated under vacuum at  $275^{\circ}C$ , by identification of the decomposition products.

- G. G. Wanless, ANALYSIS OF COPOLYMERS BY PYROLYSIS AND MASS SPECTROMETRY, J. Polymer Sci. 62, 263 (1962)

The depolymerization behavior of copolymers of 1-pentene and 4-methyl-1-pentene was studied. Regularities in cracking patterns are shown and these regularities reflect the copolymer composition. Thus they can be used in a simplified mass spectrometric method for the analysis of such copolymers.

669 T. G. Degteva, I. M. Sedova, and A. S. Kuz'minskii, THERMAL DEGRADATION OF A FLUORINE-CONTAINING ELASTOMER OF THE KEL-F TYPE ABOVE 300°. II., Vysokomolekul. Soedi: 5, 378 (1963)

The thermal degradation of an elastomeric copolymer of trifluoro-chloroethylene and vinylidene fluoride was studied under vacuum at  $340\text{--}380^{\circ}\text{C}$ . Kinetic data are reported.

T. G. Degteva, I. M. Sedova and A. S. Kuz'minskii, MECHANISM OF THE THERMAL DEGRADATION OF A KEL-F-TYPE ELAST/)MER IN THE TEMPERATURE RANGE 200-380°, Vysokomol.kul. Soedin. 5 (10), 1485 (1963)

Two elastomeric copolymers of CH<sub>2</sub>:CF<sub>2</sub> and Cl<sub>2</sub>CHCF<sub>3</sub> units were studied as to thermal stability and the mechanism of their thermal degradation.

H. Kambe, Y. Shibazaki, and T. Iwamoto, THERMAL DEGRADATION OF STYRENE-ACRYLONITRILE COPOLYMER, Tokyo Daigaku Koku Kenkyusho Shuho 3 (7), 690 (1963); C. A. 60, 10817 (1964)

Thermal degradation of styrene-acrylonitrile copolymer at  $160-210^{\circ}$  was studied by infrared spectroscopy.

W. R. Moore and E. Donnelly, THERMAL DEGRADATION OF MELAMINE-FORMALDE-HYDE RESINS, J. Appl. Chem. (London) 13 (12), 537 (1963)

TGA and infrared analysis were used to study the thermal degradation of 3 melamine-formaldehyde resins in air from 150 to  $350^{\circ}$ C. The mechanism of degradation in various temperature ranges is discussed.

K. J. Bombaugh and B. H. Clampitt, INVESTIGATION OF COMONOMER DISTRIBUTION IN COPOLYMERS WITH THERMAL METHODS, Proc. Battelle Symp. Thermal Stability Polymers, Columbus, Ohio 1963, V1; C. A. 60, 9373 (1964)

Copolymers of ethylene/methyl acrylate, ethylene/ethyl acrylate, ethylene/methyl methacrylate, and ethylene/vinyl acetate were pyrolyzed, and their pyrolyzates were examined in an effort to determine the mode of decomposition.

B. Wunderlich and D. Poland, THERMODYNAMICS OF CRYSTALLINE LINEAR HIGH POLYMERS. II. THE INFLUENCE OF COPOLYMER UNITS ON THE THERMODYNAMIC PROPERTIES OF POLYETHYLENE, J. Polymer Sci. A1, 357 (1963)

Copolymers of polyethylene containing -CO- and -CHCH3 units were investigated by means of DTA and X-ray methods.

N. L. Zutty and F. J. Welch, SYNTHESIS OF VINYL POLYMERS CONTAINING α-SUBSTITUTED γ-BUTYROLACTORE GROUPS IN THEIR BACKBONES, J. Polymer Sci. A1, 2289 (1963)

When vinyl chloride-methyl methacrylate copolymers having a uniform chain-to-chain composition, are pyrolyzed at temperatures around  $150^{\rm O}{\rm C}$ , an intramolecular lactonization occurs forming  $\alpha\text{-methyl-}\gamma\text{-butyrolactone}$  groups in the polymer backbone concomitant with the quantitative elimination of methyl chloride.

676 H. F. Mark and N. Ogata, COPOLYMERIZATION OF ALDEHYDES, J. Polymer Sci. A1, 3439 (1963)

The thermal stability of the copolymers of formaldehyde and acetaldehyde reaches a minimum in the composition range of 40/60 to 60/40. If it is supposed that the thermal degradation occurs at the end of the polymer chain, the copolymers with a composition in the range of 40/60 to 60/40 of formaldehyde and acetaldehyde, may undergo degradation with relative ease because of the large number of branches in the polymer chain.

677 K. Hayashi, H. Watanabe, and S. Okamura, RADIATION INDUCED SOLID STATE COPOLYMERIZATION OF OXETANES, J. Polymer Sci. B1, 397 (1963)

Some DTA studies are reported.

- E. M. Barrall II, R. S. Porter, and Julian F. Johnson, GAS CHROMATOGRA-PHIC ANALYSIS OF POLY(ETHYLENE ETHYL ACRYLATE) AND POLY(ETHYLENE VINYL ACETATE) PYROLYZATES, Anal. Chem. 35, No. 1, 73 (1963)
- 679 S. Igarashi and H. Kambe, THERMOGRAVIMETRIC ANALYSIS OF STYRENE-ACRYLONI-TRILE COPOLYMERS, Makromol. Chem. 79, 180 (1964)

Effect of molecular weight and composition on thermal stability of title copolymers was studied by TGA under nitrogen at 258-458°. The molecular weight of the copolymer has little effect on thermal decomposition and the amount of residue after decomposition increases with the acrylenitrile content of the copolymer.

- Y. Shibazaki and H. Kamebe, THERMAL DEGRADATION PRODUCTS OF POLYMERS BY GAS CHROMATOGRAPHY. III. STYRENE-ACRYLONITRILE COPOLYMERS, Kobunshi Kagaku 21 (225), 71 (1964); C. A. 61, 3220 (1964)

Y. Shibazaki, STUDIES ON THERMAL DEGRADATION PRODUCTS OF POLYMERS BY GAS CHROMATOGRAPHY. IV. EOUNDARY EFFECT ON THE THERMAL DEGRADATION OF COPOLYMERS, Kobunshi Kagaku 21 (226), 125 (1964); C. A. 61, 7127 (1964)

Rapid thermal degradation of copolymers gives monomers, the yield of which differs from that of monomers produced by pyrolysis of each component homopolymer. The difference is attributed to a different probability of splitting off a monomer unit from the end of the chain having a free radical according to whether the neighboring units are the same or not. This phenomenon is called the "boundary effect". Proposes a method for quantitative evaluation of the boundary effect.

- H. T. G. Degteva and A. S. Kuz'minskii, THERMOOXIDATIVE DEGRADATION OF A COPOLYMER OF TRIFLUOROCHLOROETHYLENE AND VINYIDENE FLUORIDE AT TEMPERATURES ABOVE 300°, Vysokomolekul. Soedin. Khim. Svoistva i Modifikatsiya Polimerov, Sb. Statei 1964, 110; C. A. 62, 2897 (1965)

- 692 M. Baer, ANIONIC BLOCK POLYMERIZATION. II. PREPARATION AND PROPERTIES OF BLOCK COPOLYMERS, J. Polymer Sci. A2, 417 (1964)

TGA was used to compare heat stability. Studied block copolymers of a-methylstyrene/styrene, methyl methacrylate/styrene and ethylene oxide/styrene. The temperature at the inflection point in the TGA curve for the various polymers is tabulated and compared.

693 K. Okuda, STRUCTURES OF VINYLIDENE CHLORIDE-VINYL CHLORDIE COPOLYMERS, J. Polymer Sci. A2, 1749 (1964)

Specific heats were measured in the powder state with an automatic recording differential thermal analyzer and an adiabatic calorimeter.

- P. H. Hess D. F. Percival, and R. R. Miron, AMBIENT TEMPERATURE CURE IN UNSATURATED POLYESTER-STYRENE COPOLYMERIZATIONS. RELATIVE EFFECTIVE-NESS OF INITIATOR-PROMOTER SYSTEMS, J. Polymer Sci. <u>B2</u>, 133 (1964)
- 4. P. Castille and V. Stannett, THE RADIATION INDUCED COPOLYMERIZATION OF FORMALDEHYDE AND STYRENE, J. Polymer Sci. B2, 1097 (1964)

Reports results of a DTA and TGA study of polyoxymethylene, polystyrene, and the title copolymer. Found that incorporation of styrene groups in the polyoxymethylene chain, even in very small amounts, causes a substantial improvement in the thermal stability of the polyoxymethylene.

D. K. Thomas, HEAT AGING IN FLUOROELASTOMERS, J. Applied Polymer Sci. 8, 1415 (1964)

Continuous and intermittent stress relaxation measurements were made on a copolymer of vinylidene fluoride and hexafluoropropylene crosslinked with diamines or high energy radiation, and a study was made of the effect of neat on the raw polymer. The results show that heat aging in diamine vulcanizates is the result of two simultaneous processes. One is a rapid oxidative reaction in and at the crosslinks resulting in replacement of primary crosslinks by a more thermally stable type, and the other is an oxidative reaction in the polymer main chain leading to a very slow breakdown of the rubber network.

697 H. E. Hoyt, B. D. Halpern, and K. C. Tsou, EVALUATION OF POLY(2,6-DI-METHYL)-1,4-PHENYLENE OXIDES AND RELATED COPOLYMERS FOR HIGH TEMPERA-TURE ADHESIVE APPLICATION, J. Applied Polymer Sci. 8, 1633 (1964)

Most of the high temperature evaluations were carried out at  $500^{\rm O}{\rm F.}$  and  $600^{\rm O}{\rm F.}$  over periods from 30 min. to one week. All specimens show thermal decomposition at  $750^{\rm O}{\rm F.}$  to give a hard solid residue. Thus, this temperature must be accepted as the upper limit for the uncompounded adhesive.

R. J. Schaffhauser, M. C. Shen, and A. V. Tobolsky, VISCOELASTIC PROPERTIES OF STYRENE-ACENAPHTHYLENE COPOLYMERS IN THE TRANSITION REGION,
J. Applied Polymer Sci. 8, 2825 (1964)

Some DTA studies are reported.

699 K. J. Bombaugh and B. H. Clampitt, INVESTIGATION OF COMONOMER DISTRIBU-TION IN ETHYLENE COPOLYMERS WITH THERMAL METHODS, J. Polymer Sci. A3, 803 (1965)

Pyrolysis-gas chromatography was used to study ethylene-acrylate and ethylene-vinyl acetate copolymers. Some DTA studies are also reported.

J. B. Kinsinger, J. R. Panchak, R. L. Kelso, J. S. Bartlett, and R. K. Graham, METHYL α-CYANOACR'LATE. II. COPOLYMERIZATION STUDIES, J. Applied Polymer Sci. 9, 429 (1965)

Reports some thermal degradation results for poly(methyl  $\alpha$ -cyanoacrylate), methyl  $\alpha$ -cyanoacrylate/methyl methacrylate copolymers, methyl  $\alpha$ -cyanoacrylate/styrene copolymers, methyl  $\alpha$ -cyanoacrylate/vinyltoluene copolymers, and methyl  $\alpha$ -cyanoacrylate/methylstyrene copolymers.

#### NATURAL POLYMERS AND MATERIALS DERIVED FROM THEM

701 L. R. Parks and L. H. Sperling, PHYSICOCHEMICAL STUDIES OF CELLULOSE ACETATE DECOMPOSITION REACTIONS, J. Applied Polymer Sci. 8, 2239 (1964)

Studied the origin, mechanism of formation, and structure of the colored compounds formed upon heating cellulose acetate in the presence of plasticizer.

702 W. K. Tang, EFFECT OF FLAME RETARDANTS ON PYROLYSIS AND COMBUSTION OF α-CELLULOSE, J. Polymer Sci. C, No. 6, 7.

Thermogravimetric and differential thermal analyses were conducted to determine the effect of low concentrations of flame retardants on the kinetics of pyrolysis and phenomena of combustion of  $\alpha$ -cellulose.

A bibliography of references, many of them annotated, is presented. This bibliography is the result of a literature survey on thermal degradation, thermal oxidation and thermal analysis of high polymers. These references cover the period from about 1 October 1962 to 1 March 1965. 702 items are given. These are grouped under general and material headings. A subject index and an index of authors are provided. This bibliography brings PLASTEC NOTE 7, published June 1963, up-to-date.

#### INSTRUCTIONS

- 1. ORIGINATING ACTIVITY Enter the name and address of the contractor, subcontractor, grantee, Department of Defense activity or other organization (corporate author) issuing the report.
- 2a. REPORT SECURITY CLASSIFICATION: Enter the overall security classification of the report. Indicate whether "Restricted Data" is included. Marking is to be in accordance with appropriate security regulations.
- 2b. GROUP: Automatic downgrading is specified in DoD Directive 5200.10 and Armed Forces Industrial Manual. Enter the group number. Also, when applicable, show that optional markings have been used for Group 3 and Group 4 as authorized.
- 3. REPORT TITLE: Enter the complete report title in all capital letters. Titles in all cases should be unclassified. If a meaningful title cannot be selected without classification, show title classification in all capitals in parenthesis immediately following the title.
- 4. DESCRIPTIVE NOTES: If appropriate, enter the type of report, e.g., i-terim, progress, summary, annual, or final. Give the inclusive dates when a specific reporting period is covered.
- 5. AUTHOR(S): Enter the name(s) of author(s) as shown on or in the report. Enter last name, first name, middle initial if military, show rank and branch of service. The name of the principal author is an absolute minimum requirement.
- REPORT DATE: Enter the date of the report as day, month, year; or month, year. If more than one date appears on the report, use date of publication.
- 7a. TOTAL NUMBER OF PAGES: The total page count should follow normal pagination procedures: i.e., enter the number of pages containing information.
- 75. NUMBER OF REFERENCES: Enter the total number of references cited in the report.
- 8a. CONTRACT OR GRANT NUMBER: If appropriate, enter the applicable number of the contract or grant under which the report was written.
- 86. 8c. 8t 8d. PROJECT NUMBER: Enter the appropriate military department identification, such as project number, subproject number, system numbers, task number, etc.
- 9a. ORIGINATOR'S REPORT NUMBER(S): Enter the official report number by which the document will be identified and controlled by the originating activity. This number must be unique to this report.
- 9b. OTHER REPORT NUMBER(S): If the report has been assigned any other report numbers (either by the originator or by the sponsor), also enter this number(s).

- 10. AVAILABILITY/LIMITATION NOTICES: Enter any limitations on further dissemination of the report, other than those imposed by security classification, using standard statements such as:
  - "Qualified requesters may obtain copies of this report from DPC."
  - (2) "Foreign announcement and dissemination of this report by DDC is not authorized."
  - "U. S. Government agencies may obtain copies of this report directly from DDC. Other qualified DDC users shall request through
  - (4) "U. S. military agencies may obtain copies of this report directly from DPC. Other qualified users shall request through
  - (5) "All distribution of this report is controlled. Qualified DDC users shall request through

If the report has been furnished to the Office of Technical Services, Department of Commerce, for sale to the public, indicate this fact and enter the price, if known.

- 11. SUPPLEMENTARY NOTES: Use for additional explana-
- 12. SPONSORING MILITARY ACTIVITY: Enter the name of the departmental project office or laboratory sponsoring (paying for) the research and development. Include address.
- 13 ABSTRACT Enter an abstract giving a brief and factual summary of the document indicative of the report, even though it may also appear elsewhere in the body of the technical report. If additional space is required, a continuation sheet shall be attached.
- It is highly desirable that the abstract of classified reports be unclassified. Each paragraph of the abstract shall end with an indication of the military security classification of the information in the paragraph, represented as (TS), (S), (C), (C), (C)

There is no limitation on the length of the abstract. However, the suggested length is from 150 to 225 words.

14. KEY WORDS: Key words are technically meaningful terms or short phrases that characterize a report and may be used as index entries for cataloging the report. Key words must be selected so that no security classification is required. Identies, such as equipment model designation, trade name, military project code name, geographic location, may be used as key words but will be followed by an indication of technical context. The assignment of links, rules, and weights is optional.
